Section 2.3: *Materials move across the cell's membranes.*

How do materials move across the cell's membranes? (part 2)

1. What is active transport? _____

2. Why might material need energy to move through the cell membrane?

a. _____

b. _____

3. Draw arrows in the diagram to the right, indicating the direction in which the particles move across the membrane via **active transport**.

4. What are two ways in which a particle that is too large to fit through the cell membrane can enter the cell?

a. _____

b. _____

5. In space below, explain what is happening in the diagram through the process of **endocytosis**.

6. In space below, explain what is happening in the diagram through the process of **exocytosis**.
